Many movies released after 2020 cluster at lower inflation-adjusted opening weekend revenues, with a few major exceptions.

Over movie history, what has been the trend for opening weekend revenue?

Represented in this graph we have taken existing movie data and converted it to modern dollar amount so that the Plainfield for comparing data is equal across the board. Sean above it is clearly easy to spot that modern movies since the pandemic have been clustering around a lower dollar amount showing that factors are pulling the industry average for revenue down.

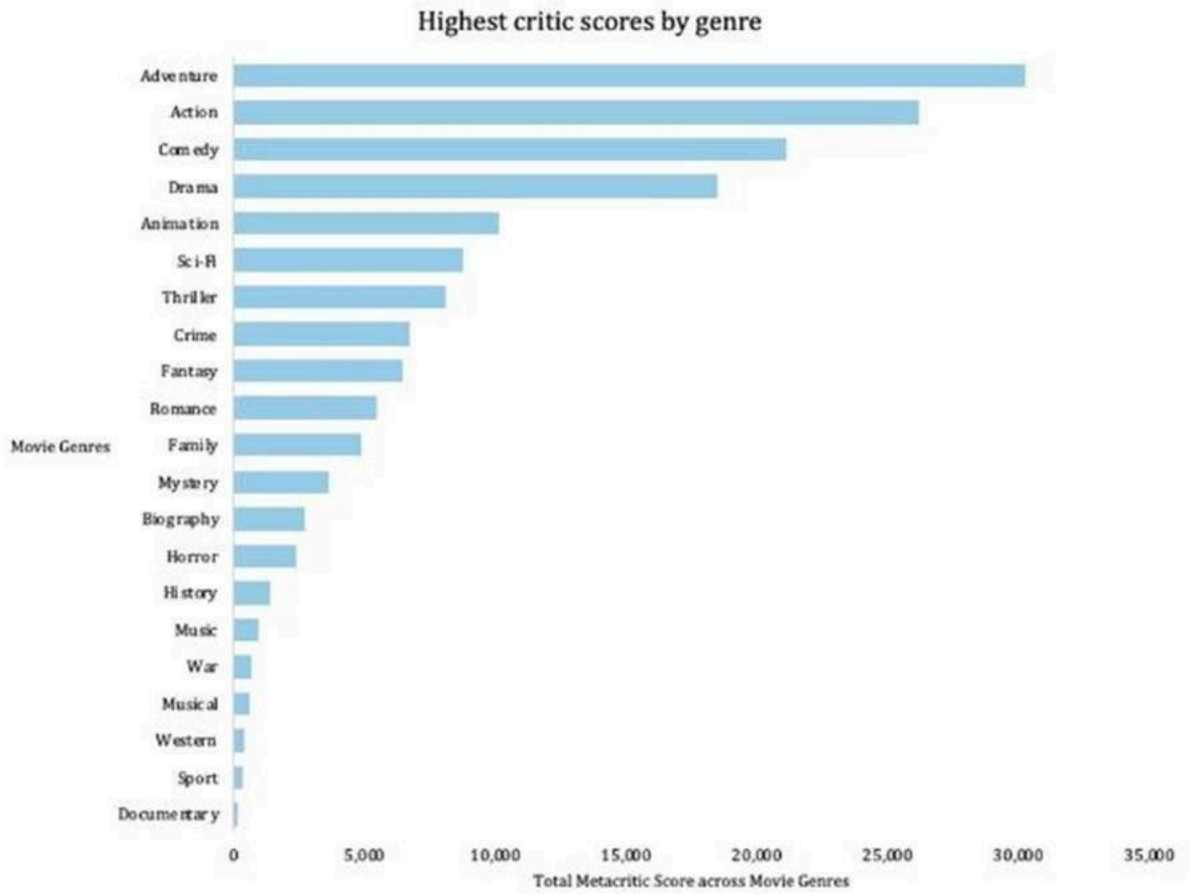

Most movies run about 90 to 140 minutes, while fewer long movies create a right-skewed distribution.

What can be seen with the distribution of the top 1000 movies?

As seen in the graph above the distribution of movies centralizes around one hour and 30 minutes, showing an industry average on movie time. The reason for the centralization can be pinpointed to movie budget and existing norms, but some directors like to go a step above and would rather make their movie longer than shorter as shown with the right skew of this graph. With the longer films, they have more time to show character development and are able to paste scenes without time limitations.

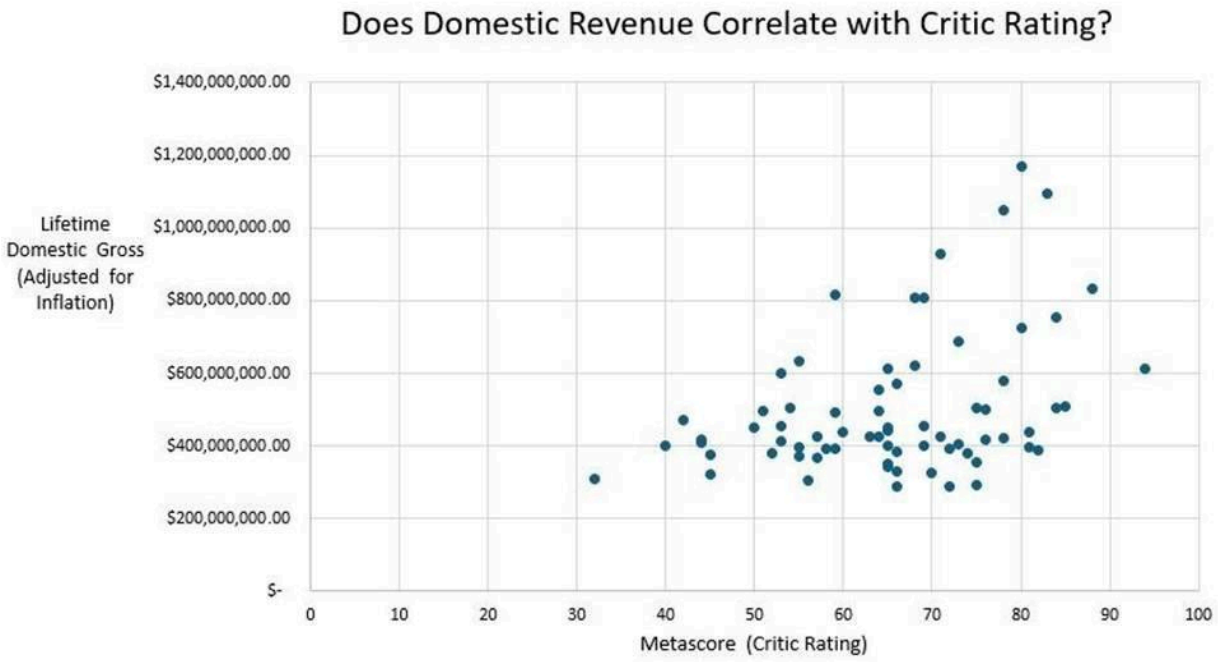

The total Metacritic score across movie genres appears to be right-skewed, led by Adventure and lowest for Documentary.

What effect does the genre of the film have on its critical rating?

Movies that more tailored for the masses would have to be action, adventure, and comedy as these are applicable to most people and as seen with the graph skewed down some genres do worse than others, as in the case with war, history and sports being a less entertaining topic, which can be related to a smaller interest group for movie watchers. Excel clearly ranks which genres are most preferable in the industry. Which can help move makers decide on what film to make next.

Higher critic ratings do not consistently correspond to higher domestic box office earnings.

Does revenue relate to a movie's critic rating score?

As seen in the graph above, there is some correlation to critic rating and revenue, but there are definitely outliers. Just because a movie has a high rating doesn't always mean it will pull in more revenue as seen in the spread of the data. Excel helps us clearly see that with our ex being critic rating and why being domestic gross adjusted points X 59 and Y 800 million, has a sharp contrast with X 82 and Y380 million
